Features.

- **Measures without shifting the point of application of force**
- By means of a special force transmission system, the mechanical calibration system No. 7792 prevents the point of force application from shifting during the calibration process
- The lever mounted below the test rail is moved linearly by a spindle and is driven by the handwheel
- The linear motion is transformed into a rotational motion which influences the transducer
- The torque wrench to be calibrated remains in its position throughout the calibration
- This prevents measurement errors resulting from a shift in the point of force application
- The torque wrench is automatically aligned horizontally by means of a low-friction ball bushing
- An additional ball bushing ensures friction-free positioning of the torque wrench
- The resulting reduction in the transverse forces on the transducer and the friction on the torque wrench assembly reduces measurement errors
